

HJR Equipment and the Autobrace2 were developed by a group of industry leaders from both the fire/rescue field and the manufacturing industry. By utilizing the expertise from everyone involved, the Autobrace2 vehicle stabilization system was created. The Autobrace2 system meets all of the vehicle stabilization criteria that industry professionals have been asking for. The Autobrace2 system is easily transported to the rescue site by way of its carry bracket. The struts are quickly deployed; most rescuers can have the vehicle stabilized in less than one and half minutes. There are only two pins that need to be placed in the system to be operational and there are spare pins located on the brace in case you loose a pin. Set up can be done by one person, keeping vital manpower free to attend to patient care.

The Autobrace2 is available in both a long strut version and a short strut version. We offer the ability to purchase two, three or four strut kits and these kits can be configured in any combination of long and short struts to suite your needs.

The Autobrace2 vehicle stabilization system incorporates the ratchet strap directly onto the strut. There are no internal parts to our ratchet strap assembly; the ratchet strap is totally exposed for easy use, care and inspection of the strap assembly.

The Autobrace2 vehicle stabilization kit is made of plated steel for years of dependable service. All components of the Autobrace2 kit can be purchased separately to enhance the ability to support any vehicle anytime.

The Autobrace2 Vehicle Stabilization Kit can be utilized to support any type of vehicle in following situations:

- ❖ A Vehicle on its side.
- ❖ A Vehicle on its roof.
- ❖ A Vehicle against a tree or pole.
- ❖ Vehicles on top of another vehicle.
